Project Resumista

January 15th, 2019

Executive Summary:

Project Resumista consists of three individuals who are named below, who are aspiring software developers, part of the Geekwise Academy. We are taking part in the JavaScript No-Instructor course in January 2019, and were presented with a topic of developing an application that would fill a social impact need. The need we decided to attempt to solve is helping those who do not have the needed resources or people in their life, to help build them an impactful resume. This can be either first time job seekers, high school students, or even someone just simply getting back on their feet. This tool will be an application where we take the guesswork out of the equation, and build them a professional resume, by simply taking in the user input, and formatting it in a professional yet stylish resume, that they can use to land their desired job.

Project Description :

Essentially this application will be a simple, easy-to-use tool where we present the user with an easy to read form, with checkboxes, radio buttons, input fields and whatever else may be needed to format on a page into an easily printable document.

Functionality:

The application will be a single-page web app that presents the user with input forms built in an easily navigable carousel. It will include separate forms to gather the user's basic information, work history, volunteer history, and education history. It will then populate a styled resume which can be easily printed by the user.

Stakeholders:

Luckily for us, there are no essential stakeholders in the project besides the people developing the application for the end users. Perhaps there are some agencies out there that do provide services underprivileged people who need help with resume workshops, and could be a great tool for them to cut down hours.

Project Scope Requirements:

Platform:

The primary platform our solution will be built in is the web meaning we will be using these technologies to build the web application:

- HTML
- CSS/Bootstrap
- Vanilla Javascript

This will only be a web application right now, we will design it with "mobile-first" in mind. The major goals of the web application are listed on the following page.

Goals:

1. **Simple forms that store user data:** Create an easy-to-navigate carousel with separate forms and a JS object to store the user's input.

2. **Generate a styled resume :** Populates a final resume with the user's submitted info.

3. **Print the resume:** Print the resume so that it appears correctly formatted on a standard, letter-size paper document.

Timeline:

The project is due for presentation for February 21st.

Budget:

Just money for coffee, lots and lots of coffee….
